## 1. Overview

CMW-Admin is a Java administrative tool for the Controls MiddleWare (CMW). It's a "tree-based" application that allows to quickly view the state of several CMW servers. Users can customize the tree to monitor only the servers they want to look at. The program supports access to database for an easier configuration.

**Warning:**

To launch CMW Admin from your web browser you need a working [Java Web start](#).

Instead thousand words, here is how CMW Admin looks like:

## 2. Release notes

Version	Notes
1.1.2 (current)	<ul style="list-style-type: none"> <li>• Server search added.</li> <li>• Some bugs fix (mainly ref files).</li> <li>• Package accsoft-gui-frame is used in Device Explorer.</li> </ul>

	<ul style="list-style-type: none"><li>• Group maker (Find server extension).</li><li>• Configuration files (xml and pref) improved.</li></ul>
--	---

### 3. Know bugs

- Win/Linux: Sometimes problems with homopath when switch from Win to Linux or from Linux to Win.
- Some nodes have "..." in their name in server tree.
- Under Windows "Save web" fail sometimes (maybe a Samba PSLXGWPC server problem).

PS: We want to make this section disappear ;)

### 4. Bugs report and remarks

Please report bugs and remarks to [Joel LAUENER](#).
